

Management Console

Jitterbit Harmony Management Console

Management Console

Overview

The Management Console, accessible through the [Jitterbit Harmony Portal](#), provides administrators the ability to manage integration projects for an entire Jitterbit Harmony organization. It provides the ability to define the integration project lifecycle specific to the organization, along with the tools to enforce the security and access control rights for each defined stage of the lifecycle (e.g. development, testing, production).

The Management Console communicates with Jitterbit Harmony through a well-defined set of management APIs. All users of these APIs must be authenticated with Jitterbit Harmony and all communication is handled securely over HTTPS.

The management functions provided to the user are further controlled by access control rights defined for each environment. Any user accessing the Management Console will be able to see only the data the user has been given permission to see. Access controls are applied to any and all functions, including searching for operation information, running operations, and viewing logs.

NOTE: The Management Console was formerly called the Web Management Console or WMC.
