

Operation Settings

Jitterbit Cloud Studio

Operation Settings

Overview

After an operation is created, you can further configure the operation using its operation settings. The operation settings screen includes three tabs, covered respectively on these pages:

- **Operation Schedules**
Each operation can be configured to run automatically by creating and applying a schedule.
- **Operation Actions**
Each operation can be configured with actions to take upon success or failure of the operation, including running another operation or sending an email notification. The result will be linked operations or notifications that are kicked off when conditions are met.
- **Operation Options**
Each operation can be configured with options such as when the operation will time out, what to log and the timeframe for logging, when the operation will run, or whether to use chunking.

Accessing Operation Settings

Operation settings are accessible from the [project pane](#) in both the **Workflows** and **Components** tabs, and from the [design canvas](#):

- **Project Pane:** In the **Workflows** or **Components** tab of the project pane, hover over an operation name and click the actions menu icon  to open the actions menu. From the menu, select **Settings**.
- **Design Canvas:** In the top right of an operation, click the actions menu icon  to open the actions menu. From the menu, select **Settings**.
