

Jitterbit Entities

Jitterbit Harmony Design Studio

Jitterbit Entities

Overview

Jitterbit Entities are only used in the creation of [OData Service APIs](#). A Jitterbit Entity defines a database or SAP endpoint, a selection of tables, and a selection of fields that provide the data to an [OData Service API](#).

Jitterbit Entities are created within a Jitterbit [Design Studio](#) project, and a project may contain multiple entities.

Each API Entity Operation is created within and assigned to a Jitterbit Entity. A Jitterbit Entity may be assigned one or more API Entity Operations, but each Entity is limited to only one API Entity Operation per HTTP method.

Jitterbit Entities and API Entity Operations are assigned to [OData Service APIs](#) when the APIs are created. See these articles for additional information:
